HTML-CSS ASSIGNMENT – 2

By – Anamika Singh

1. **Do we use hidden fields in our forms? If yes, examples. If no, why?**
   - Yes, hidden fields can be used in hidden forms.
   - They are usually used to include additional data in a form that is not displayed to the user but is submitted along with the rest of the form data.
   - They are useful for including data that you want to pass to the server without requiring user input or displaying it to the form.
   - **Example:** This data can be used, to store session identifiers, flags, or any other information needed by the server – side code handling the form submission.

2. **Difference between authorization, authentication, verification, and validation.**
   - **Authorization:** Authorization is a process by which a server determines if the client has permission to use a resource or access a file. Authorization determines their access rights.
   - **Authentication:** Authentication verifies the identity of a user or service.
   - **Verification:** Verification evaluates software artifacts (such as requirements, design, code, etc.) to ensure they meet the specified requirements and standards. It ensures the software is built according to the needs and design specifications.
   - **Validation:** Validation evaluates software to meet the user's needs and requirements.
